How to connect a Razer keyboard or mouse to a PC via Bluetooth

This video is a step-by-step process on how to connect a Razer keyboard or mouse to a PC via Bluetooth.

Before connecting your Razer keyboard or mouse via Bluetooth, ensure it is sufficiently charged. For devices that use disposable batteries, insert the required type and number of batteries.

Let's get started.

For a Razer keyboard:

Set the mode switch to "BT".

Depending on your device model, you will need to press and hold a profile button or certain key combinations for five seconds. The LED indicator or corresponding numerical key on your keyboard will then light up or blink. Check your device's user guide for more information.

Enable Bluetooth on your PC then select the Razer keyboard from the list of devices found.

For a Razer mouse:

Push the slider switch to Bluetooth mode.

Depending on your device model, you will need to either press and hold the pair or switch button, or press certain button combinations for three seconds. Some models will require you to select a slot first before pairing. Check your device's user guide for more information.

Enable Bluetooth on your PC then select the Razer mouse from the list of devices found.

Wait until the Razer mouse pairs with your PC. When paired, the Razer logo or status indicator will briefly turn static blue or the corresponding slot color.

That's it! You have successfully connected your Razer peripheral to your PC via Bluetooth.
